

Cutting-edge solutions in wire processing

Komax is launching new accessories for wire processing machines to meet our customers' requirements in the fast growing markets like India, Russia, China and Brazil even more effectively.

For instance, the new ads 112 from Komax is a pull-feed machine that feeds wire even faster and more gently thanks to its superb power transmission, while increasing the production capacity in the process. The new ims 291 SC inkjet marker can now be employed more flexibly and prints faster and uses up less ink than ever before. The 351 barcode scanner is fully coordinated with the TopWin machine software so you can avoid production mistakes from the outset. And finally, with our crimp module analyzer, we provide you with a new tester that allows the functionality and quality of Komax MCI and BT presses to be checked even more comprehensively.

In recent months, Komax has carried out interesting projects involving fully automatic block loading (Zeta 655). These projects were primarily for customers that are pushing for increased automatic processing of harnesses in the automotive sector. The loader is fortunately also in demand among smaller customers in Europe and the US, where rising wage costs are increasingly forcing them to invest more in automation.

We are already looking forward to presenting our innovative news in stripping, crimping and harness assembling to you at this year's Productronica Show in Munich. Our preparations for this major event are moving full speed ahead.

Last but not least, we have expanded our service and business network by setting up representative offices in Bulgaria, Serbia and Belarus, so we are even closer and more responsive to our customers in these regions.
